Processing Custom Job

Now here, to process the queued job, you need to run the queue worker by executing:

---

php artisan queue:work

This starts the worker, which listens for and processes jobs from the **jobs** table.

After dispatching the job through your controller, monitor the terminal output running the queue worker. You should see log messages indicating that the report generation process has started and completed. Additionally, check your **storage/logs/laravel.log** file to confirm that the logs generated within your job are recorded.

This whole approach offloads heavy tasks to background processes, ensuring non-blocking execution, and maintaining a responsive application.
