Recipe 4: Automating Recurring Tasks

Whether it is cleaning up logs, sending out weekly summaries, or refreshing cache data, all such recurring tasks need to be executed reliably without manual intervention. And we want to automate these tasks to improve efficiency and also to reduce human error. To achieve this, you decided to implement Laravel's built-in Scheduler, which can schedule and run recurring tasks automatically. So here, we will try to leverage Laravel Scheduler to define and execute recurring tasks seamlessly. This integration will enable to automate routine operations such as database maintenance, cleanup procedures, and regular report generation, all without the need to run repetitive manual commands.

Configuring Scheduler

The Laravel Scheduler allows you to fluently and expressively schedule command execution within your Laravel application. It provides a single, convenient API for defining scheduled tasks inside the **App\Console\Kernel.php** file. The scheduler is designed to work hand in hand with Linux's cron system; you only need to set up one cron entry that runs every minute to allow Laravel's scheduler to handle the rest.
