Now to begin, first open the **Kernel.php** file wherein you will see a **schedule()** method, which is where all scheduled tasks are defined. Here, you can schedule commands, closures, and even callable functions.

So now, we define a recurring task that clears old logs daily. For this, we add the following code to the **schedule()** method inside the **Kernel** class:

```
protected function schedule(Schedule $schedule)

{

    // Clear application logs daily at midnight.

    $schedule->command('logs:clear')->daily();

    // Optionally, you can schedule other tasks, for example:

    // $schedule->command('backup:run')->weekly();

    // $schedule->call(function () {
```
