Recipe 1: Installing PHP 8 and Laravel 11 using Composer

You work in a lively office where a new Linux server was just delivered to our team. The system is totally barebones—no PHP, Composer, or Laravel installed—and you are all set to dive in and get everything up and running. Today, we're laying the groundwork for an exciting project by installing PHP 8.0 as the base for Laravel 11.We will use Composer as our go-to dependency manager to fetch Laravel, configure essential environment variables, and then verify that everything's working. This live scenario is set up so that each step builds on the last one, getting you ready for a smooth transition into more advanced development tasks.

Installing PHP 8.0

Before diving into new installations, it's essential that you update your Linux server to ensure that every package is current. To do this, type in:

```
sudo apt update && sudo apt upgrade -y
```
