configuration in the **disks** array:

```
'media' => [

    'driver' => 'local',

    'root' => storage_path('app/media'),

    'visibility' => 'private',

],
```

In the above config, you define a dedicated disk named **media** that stores files in the **storage/app/media** directory. The **visibility** parameter is set to ensuring that files on this disk are not publicly accessible by default.

Now, we have to create a media directory as below:

```
mkdir -p storage/app/media
```
