Securing File Access

Setting Linux File Permissions

For secure file storage, you want to ensure that the media directory is only accessible to the web server user (typically **www-data** on Linux) and the application itself. This prevents unauthorized access from other users on the system.

Now here, you can change the ownership of the media directory to the web server user by doing the following:

```
sudo chown -R www-data:www-data storage/app/media
```

This assigns the web server user and group as the owner of the media directory and all its contents. We can then set the appropriate permissions to ensure the directory is readable and writable by the owner, and not accessible by others:
