sudo chmod -R 700 storage/app/media

The **700** permission grants full access to the owner while denying access to group and others. If your application architecture requires group sharing, you might adjust this to **750** (owner full access, group read/execute, others no access).

Configuring Public Access

Now here, if you require controlled public access (for example, for user avatars), you might use Laravel's **storage:link** command with additional security measures siuch as, if you decide to serve some media files publicly, run:

---

php artisan storage:link

This command creates a symbolic link from **public/storage** to However, in our case, we are using the **media** disk configured as private. If you need to serve a subset of files from media with controlled access, consider creating a dedicated controller to stream files after checking user permissions instead of a direct symbolic link.
