```
        // Store the file in the 'media' disk

        $file = $request->file('file');

        $filename = time() . '_' . $file->getClientOriginalName();

        $filePath = $file->storeAs('', $filename, 'media');

         // Optionally, store the file path in the database
associated with the user or a record

        return response()->json(['message' => 'File uploaded
successfully!', 'path' => $filePath]);

    }

}
```

This controller method validates the uploaded file, stores it in the configured **media** disk, and returns a response with the file path.

Next, we add a route for the file upload endpoint in
