```
    }

     // Check if the file exists and then stream the file back

    if (!Storage::disk('media')->exists($filename)) {

        abort(404);

    }

    $path = Storage::disk('media')->path($filename);

    return response()->download($path, $filename, [], 'inline');

}
```

Next, we create a route for file retrieval:

```
Route::get('/media/download/{filename}',
[App\Http\Controllers\MediaController::class, 'download'])-
```
