The above command will synchronize your package listings with the latest repository data and upgrade any pre-installed packages. This step sets you up with a fresh system with no potential conflicts or errors in later installations.

Now our Laravel framework relies on PHP 8.0, so the next step is installing this version along with a set of critical extensions. These extensions will empower your application by handling string operations, XML parsing, network communications, and file compression.

To do this, simply run the following command:

---

```
sudo apt install php8.0 php8.0-common php8.0-cli php8.0-mbstring php8.0-xml php8.0-curl php8.0-zip -y
```

---

After the installation, make sure everything is in place by checking the PHP version:

---

```
php -v
```
