Creating Controller Method for File Downloads

Next, add another method in your **MediaController** for enabling file downloads. This method forces the file to be downloaded rather than displayed inline.

```
public function downloadFile($filename)

{

    // Verify the file exists on the 'media' disk

    if (!Storage::disk('media')->exists($filename)) {

        abort(404, 'File not found.');

    }

    // Retrieve the absolute file path

    $path = Storage::disk('media')->path($filename);
```
