After you've ensured the script is safe, run the installer with PHP:

```
php composer-setup.php --install-dir=/usr/local/bin --filename=composer
```

This command places Composer in the **/usr/local/bin** directory, allowing you to call it from anywhere. Once Composer is installed, you can perform clean up by removing the installer file as below:

```
rm composer-setup.php
```

Finally, confirm that Composer is ready for action:

```
composer --version
```
