Recipe 1: Combining Laravel Scheduler with Cron Jobs

There are several routine tasks—such as clearing logs, running periodic report generations, and refreshing cache data, which with time becomes a burden on your development team when executed manually. So, to streamline these tasks and ensure they run automatically, you may leverage Laravel's Scheduler in conjunction with Linux cron. By doing so, you can centralize all recurring tasks within Laravel and delegate their execution to a single cron entry on your Linux server. This integration ensures that scheduled tasks are automated reliably without duplicating installation procedures or requiring manual intervention.

Linking Laravel Scheduler with Linux Cron

The Laravel Scheduler allows you to define all your scheduled tasks in one place, in the **App\Console\Kernel.php** file, and then have them run automatically by triggering the **schedule:run** command every minute. This centralized approach reduces the complexity of managing multiple cron entries.

Configuring Scheduler in Kernel
