```
        // For example, refresh cache or update a dashboard.

        \Log::info('Cache refreshed at ' . now());

    })->everyThirtyMinutes();

}
```

In the above, the **logs:clear** command is scheduled to run daily at midnight, and the **reports:generate** command is set to run every Monday at 8 AM. Additionally, a closure-based task is scheduled every thirty minutes. These definitions centralize your recurring tasks in one file, making it easier to manage and adjust their frequencies as needed.

Setting up Linux Cron Job

Once you have defined your tasks in the **schedule()** method, the next step is to configure a single cron entry on your Linux server that runs the Laravel Scheduler command every minute. For this, run the following command in your Linux terminal while in the project directory, or navigate to your user's crontab:
