This should output the Composer version, showing that it's correctly installed and available for use in your upcoming Laravel setup.

Installing Laravel 11

With PHP and Composer successfully installed, the next step is installing our most awaiting Laravel 11. Now to do this, we will create a new project directory, we will simply name it "myapp" and will run the following Composer command:

```
composer create-project --prefer-dist laravel/laravel myapp "11.*"
```

What this does is, it instructs Composer to fetch Laravel version 11 along with all its dependencies. The command not only downloads the required packages but also organizes your project directory with folders like and

Next, after the command completes, move into your new project directory:
