Recipe 2: Automating Database Backups and Recovery Routines

Let's say our app is coupled with multiple database model. It may happen that we face a critical challenge: with multiple databases and increasing data volumes, the critical data need to be backed up consistently and on schedule. And, the risk of data loss due to server failures, accidental deletions, or other unforeseen issues may push us to implement an automated backup system. So here, you will learn to automate these database backups and recovery routines—ensuring that backups run reliably at scheduled intervals with minimal manual oversight, while also integrating processes for recovery when necessary. This process will be demonstrated using the Spatie Laravel Backup package along with Laravel Scheduler and Linux cron commands.

Installing and Configuring Backup Package

To automate database backups in Laravel, we will utilize the popular **Spatie Laravel Backup** package. If not already installed, open your Linux terminal in the "myapp" directory and run:
