composer require spatie/laravel-backup

Next, publish the configuration file using Artisan:

---

php artisan vendor:publish --
provider="Spatie\Backup\BackupServiceProvider"

This command creates a configuration file at where you can define what files, directories, and databases to backup, such as:

'backup' => ['name' => env('APP_NAME', 'laravel-backup'), ...] – This sets a unique name.

'source' => ['files' => ['include' => [base_path()], 'exclude' => ['vendor', 'node_modules'], ...], 'databases' => ['mysql'],], – This specifies which directories and databases should be backed up.

If your project uses multiple database connections, list them in the '**databases**' array.
