Setting up Automated Backups

With the backup configuration in place, integrate the backup routine into your automated task pipeline using Laravel Scheduler. To do this, open **app/Console/Kernel.php** and define a new scheduled task within the **schedule()** method as shown below:

```
protected function schedule(Schedule $schedule)

{

    // Run backups daily at 2 AM.

    $schedule->command('backup:run --only-db')->dailyAt('02:00');

    // Alternatively, to backup both databases and files, you can use:

    // $schedule->command('backup:run')->dailyAt('02:00');

}
```
