Recipe 4: Generating Scheduled Analytical Reports

During your performance reviews and team planning sessions, you came across an opportunity that timely, analytical reports could provide valuable insights such as trends in user activity, order statistics, content engagement, and database performance. However, manually generating these reports was time-consuming and error-prone. To streamline this process, you decided to automate analytical report generation using Laravel's Scheduler. With this setup, your application would periodically process key data, compile it into an analytical summary, and either store it for further inspection or send it directly to stakeholders. So here, you will learn how to create a custom Artisan command to generate these scheduled reports and integrate it with the Laravel Scheduler to facilitate the automated production of analytical summaries without interrupting your daily operations.

Creating Custom Artisan Command for Report Generation

The first step is to generate a new Artisan command using Laravel's built-in command generator, which we can do by running the following command:
