```
php artisan make:command GenerateAnalyticalReport
```

This command creates a new file at Next, open the generated file and you will see a basic command template. Just update it to include the logic for generating your analytical report and the command will perform database queries, process the data, and store the resulting report in a designated folder.

Following is a quick example:

```
namespace App\Console\Commands;

use Illuminate\Console\Command;

use Illuminate\Support\Facades\DB;

use Illuminate\Support\Facades\File;

class GenerateAnalyticalReport extends Command
```
