```
sudo chown -R www-data:www-data storage bootstrap/cache
```

This command assigns **www-data** as both the owner and group for these directories, ensuring that files created by Laravel will have the correct access rights for the web server. This step is critical for both security and functionality, as improper permissions can lead to application errors.

Modifying Permissions

Next, let's update the directory permissions so that the owner and group have full read, write, and execute permissions, while others can read and execute only. Simply run the following command:

```
sudo chmod -R 775 storage bootstrap/cache
```

The permission code **775** guarantees that you (as part of the
