Recipe 3: Configuring Linux Tools for Laravel

Now that you've successfully installed Laravel 11 and got the hang of its file structure and permissions on your Linux system, it's time to take things up a notch by setting up a suite of development tools that'll streamline your daily workflow. Just picture our team kicking off a new project meeting where everyone's pumped to see how a solid development environment can crank up productivity. In your development station, we will be able to set up essential tools like PhpStorm for an IDE with lots of features, Laravel Debugbar for debugging in real time, and Laravel Telescope for advanced monitoring. And when you are ready to dive into more advanced topics like debugging and performance analysis, these tools will be there for you.

Setting up PhpStorm

PhpStorm is a powerful IDE that provides intelligent code assistance and debugging features, perfect for Laravel development. There are a couple of ways to install PhpStorm on Linux, but using Snap simplifies the process.

To begin, just execute:
