```
sudo snap install phpstorm --classic
```

This will install PhpStorm with classic confinement, ensuring that all the necessary system privileges are granted. Once installed, launch PhpStorm from your application menu or by typing:

```
phpstorm
```

After starting PhpStorm, you are prompted to configure initial settings like themes, keymaps, and plugins. Now here, make sure that you install the recommended plugins such as:

- **Laravel Plugin** (for Blade support, route navigation, etc.)
- **PHP Intelephense** (for code intelligence)

You can add these plugins via **File** > **Settings** > then search for
