Installing Laravel Debugbar

The Laravel Debugbar is an indispensable tool during development. It provides a real-time overview of the application’s internal processes, such as route handling, database queries, and log messages. This insight is especially useful as you continue to refine your application and track performance bottlenecks.

So, to integrate Debugbar into the project, navigate to your project directory and run:

---

cd myapp

composer require barryvdh/laravel-debugbar --dev

This command installs the Debugbar package as a development dependency. Once the package is installed, Laravel automatically registers the Debugbar service provider. You may check your
