with the actual URL of your repository:

---

git remote add origin

This command associates your local Git repository with the remote repository to push your commits and collaborate with others. After adding the remote, push your commit to the remote repository by running:

---

git push -u origin master

This command pushes your local commits to the master branch of the remote repository and sets up tracking between your local and remote branches.

Ongoing Version Control Practices

As you work on your Laravel project, it's useful to frequently check the status of your repository:
