- Deletes a product.

Each of the above method is designed to handle a specific part of the CRUD operations.

Defining Resource Routes

Now, to ensure that each of these controller methods is reachable, you need to define a resource route in your **routes/web.php** file as below:

```
Route::resource('products',
App\Http\Controllers\ProductController::class);
```

This single line automatically maps the standard HTTP verbs (GET, POST, PUT/PATCH, DELETE) to their corresponding methods in the This efficient mapping simplifies routing and ensures consistent endpoint naming conventions across your application.
