capabilities to render complex data models passed from our controllers.

Passing Complex Data from Controller

Let us consider that we need to display a list of products with detailed information about each item. So for this, in your controller, you prepare a complex array or collection of product data. Open your ProductController and update a method to pass this structured data to a Blade view.

For example, you can modify a method named **index()** like this:

```
namespace App\Http\Controllers;

use Illuminate\Http\Request;

class ProductController extends Controller

{

    /**
```
