```
            ]

        ];

        // Pass the data to the Blade view named products.index

        return view('products.index', compact('products'));

    }

}
```

In the above, you create an array of products where each product has multiple nested attributes. This data structure can easily be expanded as you incorporate more detailed information from your database later on.

Creating Blade View to Render Dynamic Data

Now that the controller is passing complex data to the view, it's time to display this information dynamically using Blade syntax.
