```
Route::get('/products',
[App\Http\Controllers\Api\ProductApiController::class, 'index'])-
>name('api.products.index');
```

This route listens for GET requests to **/api/products** and directs them to the **index** method in the **ProductApiController** placed under the **App\Http\Controllers\Api** namespace.

Generating API Controller

Creating Controller

To create the controller, switch back to your terminal and generate the API controller using Artisan:

```
php artisan make:controller Api/ProductApiController
```

This command creates a new controller file in the **app/Http/Controllers/Api** directory. This separation keeps your
