Now, to ensure your custom API endpoint works as expected, start your Laravel development server:

```
php artisan serve
```

Open a browser or an API testing tool like Postman, and navigate to:

```
http://127.0.0.1:8000/api/products
```

You should see a well-structured JSON response containing your sample products, the success flag, and a message. This confirms that your API routes and custom JSON responses are configured correctly.
