table name cannot be inferred, you have the option to explicitly specify the table within the migration file.

When employing the **`make:migration`** command, you have the flexibility to utilize the **`--path`** option to designate a particular path for the resultant migration. The specified path should be relative to your application's base path.

Primary Key

Eloquent will additionally presume that the associated database table for each model contains an **`id`** primary key field. If required, you may designate a different column as your model's main key by creating a protected **`$primaryKey`** property on your model:

```
<?php
namespace App\Models;
use Illuminate\Database\Eloquent\Model;
class Car extends Model
{
 /*
  * The primary key associated with the table.
  *
  * @var string
  */
 protected $primaryKey = 'car_id';
}
```

Each model must have at least one **ID** that may act as its primary key according to Eloquent. Eloquent models do not allow **composite** main keys. However, in addition to the main key that uniquely identifies the table, you are allowed to add other multi-column, unique indexes to your database tables.

Timestamps

By default, Eloquent anticipates the associated database table for your model to have the fields **`created_at`** and **`updated_at`**. When models are made or changed, Eloquent will automatically set the values for these columns. You should set the **`$timestamps`** property on your model to **`false`** if you do not want Eloquent to manage these columns automatically:
