

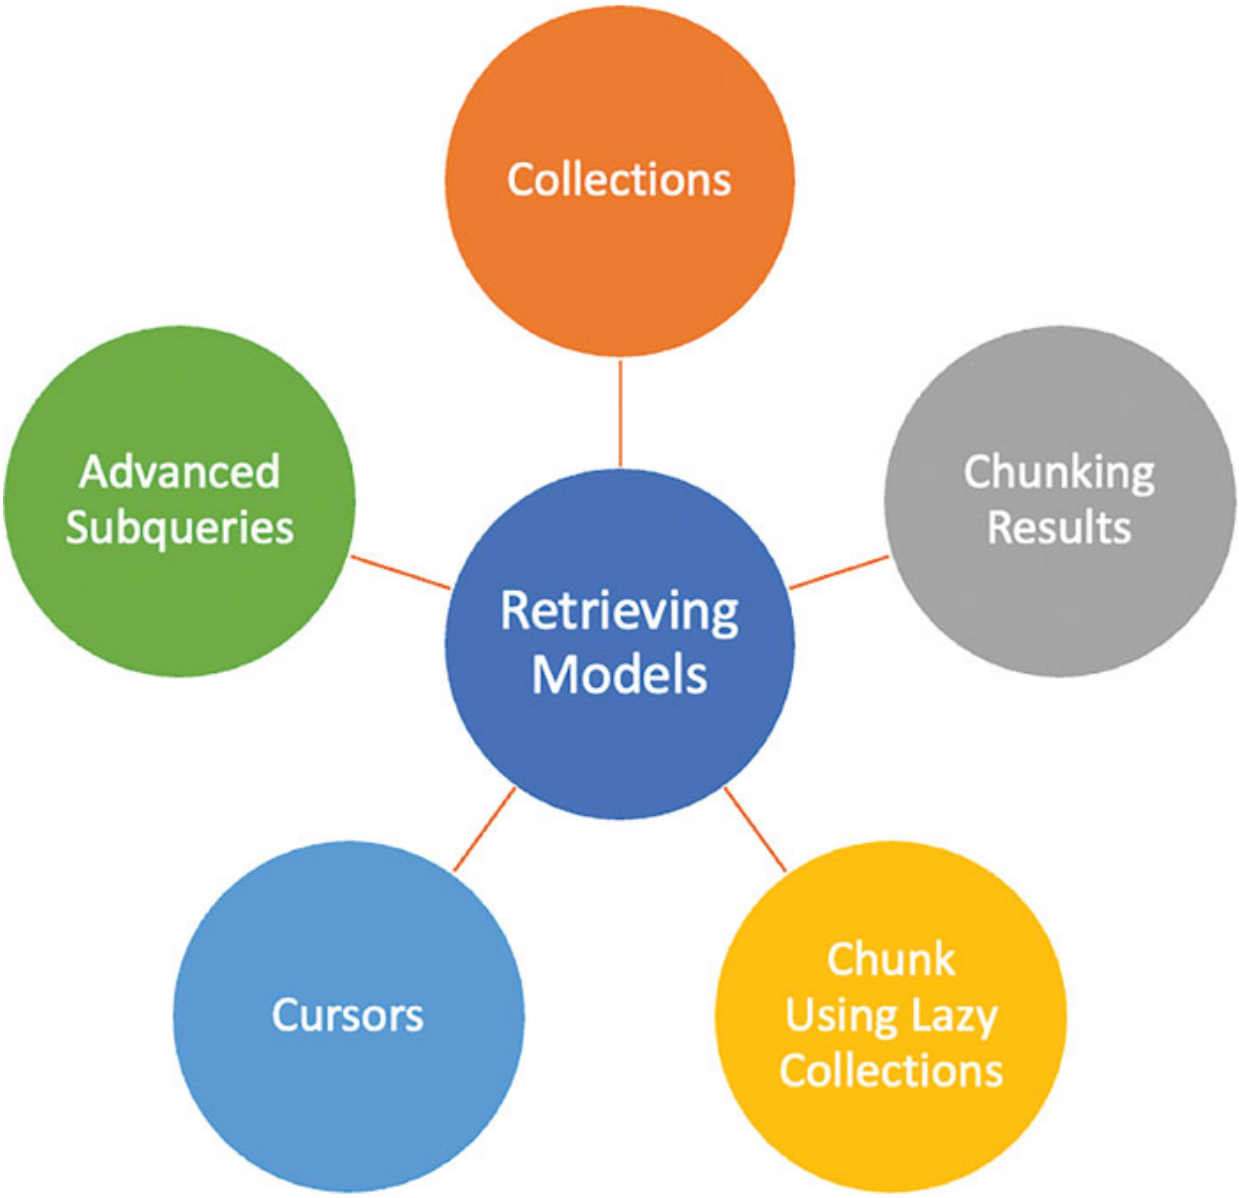

Figure 5.4: *Retrieving Models*

Collections

The fundamental **`Illuminate\Support\Collection`** class from Laravel, which offers a number of useful methods for interacting with data collections, is extended by the **`Eloquent`** Collection class. For instance, based on the outcomes of an invoked closure, the **`reject`** method may be used to delete models from a collection:

```
$offices = Office::where('location', 'NYC')->get();
$offices = $offices->reject(function (Office $office) {
```
