```
  }
}
```

Source: https://laravel.com/docs/

However, this middleware would carry out its function after the application has dealt with the request:

```
<?php
namespace App\Http\Middleware;
use Closure;
use Illuminate\Http\Request;
use Symfony\Component\HttpFoundation\Response;
class AfterMiddleware
{
  public function handle(Request $request, Closure $next):
  Response
  {
    $response = $next($request);
    // Perform action
    return $response;
  }
}
```

Assigning Middleware To Routes

You may use the **`middleware`** method while specifying the route if you want to apply middleware to particular routes:

```
use App\Http\Middleware\Authenticate;
Route::get('/EmployeeProfile', function () {
  // Code Logic
})->middleware(Authenticate::class);
```

By giving an array of middleware names to the **`middleware`** method, you may add more than one middleware to the route:

```
Route::get('/', function () {
  // Code Logic
})->middleware([First::class, Second::class]);
```
