Source: www.laravel.com

It might be returned by a route or controller once you have defined your resource collection:

```
use App\Http\Resources\UserCollection;
use App\Models\User;
Route::get('/users', function () {
  return new UserCollection(User::all());
});
```

Laravel restores the resource collection's keys to their numerical order upon returning them from a route. Nonetheless, you may provide a **`preserveKeys`** attribute in your resource class that indicates if the original keys of a collection need to be kept:

```
<?php
namespace App\Http\Resources;
use Illuminate\Http\Resources\Json\JsonResource;
class UserResource extends JsonResource
{
  /**
    * Indicates if the resource's collection keys should be
    preserved.
    *
    * @var bool
    */
  public $preserveKeys = true;
}
```

Collection keys will be kept when the collection is returned from a route or controller if the **`preserveKeys`** attribute is set to **`true`**:

```
use App\Http\Resources\UserResource;
use App\Models\User;
Route::get('/users', function () {
  return UserResource::collection(User::all()->keyBy->id);
});
```

A resource collection's **`$this->collection`** attribute is usually immediately supplied with the outcome of mapping each item to its unique resource class. Without the trailing **`Collection`** part in the class name, the single resource class is taken to be the collection's class name. Furthermore, **`Resource`** may
