On occasion, though, you might need to alter the outgoing HTTP response before sending it to the client. To do this, there are two approaches. The response method can be chained onto the resource first. An Illuminate\Http\JsonResponse object will be returned by this function, allowing you complete control over the response's headers:

```
use App\Http\Resources\UserResource;
use App\Models\User;
Route::get('/user', function () {
 return (new UserResource(User::find(1)))
     ->response()
     ->header('X-Value', 'True');
});
```

As an alternative, the resource itself may specify a withResponse method. When the resource is returned in a response as the outermost resource, this procedure will be called:

```
<?php
namespace App\Http\Resources;
use Illuminate\Http\JsonResponse;
use Illuminate\Http\Request;
use Illuminate\Http\Resources\Json\JsonResource;
class UserResource extends JsonResource
{
 public function toArray(Request $request): array
 {
  return [
   'id' => $this->id,
  ];
 }
 public function withResponse(Request $request, JsonResponse
 $response): void
 {
  $response->header('the value is', 'True');
 }
}
```
