Tajiri's critical and creative reflections on the Wall continued to evolve. Eventually, as he attempted to fully make sense of his original 1969–70 negatives, technological advances and his renewed interest helped drive an ultimate expression of his original survey. In 2003, with the help of a Macintosh G4 computer and a Nikon negative scanner, he digitized his images. He had not wanted to spend months in a darkroom, and this option allowed him to see the images at a pace and in a medium he preferred. In his first renewed attempt at this project, he randomly displayed one of every five images for an exhibition, creating a small catalog for a photography museum in The Hague. In 2005, he prepared the entire set of images in a book to be plainly titled *The Berlin Wall* (fig. 5.6). The publication would cover the entire survey project and feature an essay by Tajiri (and another by Künstlerhaus Bethanien founder Michael Haerdter). He aimed to give the book a sculptural quality by shaping it like an oversized brick. Tajiri's essay pulled together writings from various publications and newsletters and compiled his views from multiple moments in the life of the Wall:

> Seen from the air, the Wall looked like a gangrenous wound that wouldn't heal. On the East Side it appeared to be clinically clean. In an area of 100 meters along the Wall, the East had constructed concrete and iron obstacles against vehicles and had planted land mines to ward off pedestrians, who want to approach it. Soldiers with dogs patrolled regularly along its length. On the West side it was in a continuous state of festering flux. Refuse and garbage was piled against the Wall along with wrecked and abandoned cars. After a while the trash would disappear only to be replaced by more. Graffiti covered the Wall; political slogans and declarations of love. Spray Can artists had left gigantic murals at choice tourist points, only to have them covered over by more recent arrivals.
