Unlike the double-quoted and heredoc syntaxes, variables and escape sequences for special characters will *not* be expanded when they occur in single quoted strings.

```
<?php
echo ‹this is a simple string›;

echo ‹You can also have embedded newlines in
strings this way as it is
okay to do›;

// Outputs: Arnold once said: “I’ll be back”
echo ‹Arnold once said: «I\›ll be back»›;

// Outputs: You deleted C:\*.*?
echo ‹You deleted C:\\*.*?›;

// Outputs: You deleted C:\*.*?
echo ‹You deleted C:\*.*?›;

// Outputs: This will not expand: \n a newline
echo ‹This will not expand: \n a newline›;

// Outputs: Variables do not $expand $either
echo ‹Variables do not $expand $either›;
?>
```

## 4.1.2 Double quoted

If the string is enclosed in double-quotes (“), PHP will interpret the following escape sequences for special characters:

| Escaped characters | |
|---|---|
| **Sequence** | **Meaning** |
| \n | linefeed (LF or 0x0A (10) in ASCII) |
| \r | carriage return (CR or 0x0D (13) in ASCII) |
