5.2 ARRAYS

An array is a data structure that stores one or more similar type of values in a single value.

If you want to store 100 numbers then instead of defining 100 variables it is easy to define an array of 100 length.

5.2.1 Numeric Array

These arrays can store numbers, strings and any object but their index will be represented by numbers. By default array index starts from zero.

Example

Following is the example showing how to create and access numeric arrays.

Here we have used **array()** function to create **array**. This function is explained in function reference.

```
<html>
   <body>

      <?php
         /* First method to create array. */
         $numbers = array( 1, 2, 3, 4, 5);

         foreach( $numbers as $value ) {
            echo "Value is $value <br />";
         }

         /* Second method to create array. */
         $numbers[0] = "one";
         $numbers[1] = "two";
         $numbers[2] = "three";
```
