Splitting an Array into Chunks

To divide an array into smaller, evenly sized arrays, use the array_chunk() function:

;([chunks = array_chunk(array, size [, preserve_keys$

The function returns an array of the smaller arrays. The third argument, pre serve_keys, is a **Boolean value** that determines whether the elements of the new arrays have the same keys as in the original (useful for associative arrays) or new numeric keys starting from 0 (useful for indexed arrays). The default is to assign new keys, as shown here:

Keyword

Boolean value is one with two choices: true or false, yes or no, 1 or 0.

```
$nums = range(1, 7);
$rows = array_chunk($nums, 3);
print_r($rows);

Array (
  [0] => Array (
    [0] => 1
    [1] => 2
    [2] => 3
  )
  [1] => Array (
    [0] => 4
    [1] => 5
    [2] => 6
  )
  [2] => Array (
    [0] => 7
  )
)
```

Keys and Values

The array_keys() function returns an array consisting of only the keys in the array in internal order:

$arrayOfKeys = array_keys(array);

Here's an example:

```
$person = array('name' => "Fred", 'age' => 35, 'wife' => "Wilma");
$keys = array_keys($person); // $keys is array("name", "age", "wife")
```

PHP also provides a (generally less useful) function to retrieve an array of just the values in an array, array_values():

$arrayOfValues = array_values(array);

As with array_keys(), the values are returned in the array's internal order:

```
$values = array_values($person); // $values is array("Fred", 35, "Wilma");
```
