```
        $this->salary = $salary;
      }
    }
```

6.3.5 References

When you assign an object to another variable, you create a copy:

```
$fred = new Person;
$copy = $fred;
$fred->name("Fred");
print $copy->name();       // does not print "Fred"
```

You now have two Person objects, $fred and $copy, with independent property values. This is also the case when you assign the results of a call to a constructor, as shown here:

```
$fred = new Person;
```

The object created by the Person constructor is copied, and the copy is stored in $fred. This means that $this in the constructor and $fred actually refer to two different objects. If the constructor creates an alias to $this through a reference, it won't create an alias to $fred. For example:

```
$people = array();
class Person {
    function Person () {
      global $people;
      $people[] =& $this;
    }
}
$fred = new Person;
$fred->name = "Fred";
$barney =& new Person;
$barney->name = "Barney";
var_dump($people);
array(2) {
   [0]=>
   &object(person)(0) {
{
```
