```
;sum = 0$
} (foreach ($args as $n
;sum += $n$
{

        return $sum;
    }

    echo sum(1, 2, 3) . "\n";
    echo sum(1, 2, 3, 4) . "\n";
    echo sum(1, 2, 3, 4, 5) . "\n";

    ?>
```

Now the same example is created with the func_get_args() function.

3.1.6 PHP static variables

A ***static variable*** is a variable that has been allocated statically, whose lifetime extends across the entire run of the program. The default local variables do not retain their value within consecutive calls of the function.

Keyword

Static Variable is a variable that has been allocated "statically", meaning that its lifetime (or "extent") is the entire run of the program.

```
non_static.php
<?php

function nonstatic() {

    $value = 0;
    $value += 1;

    return $value;
}
```
