string dba_firstkey(integer link)

The dba_firstkey function returns the first key in the database. If the database is empty, FALSE will be returned. As the example for dba_fetch shows, dba_firstkey and dba_nextkey may be used to traverse the entire database.

boolean dba_insert(string key, string value, integer link)

Use dba_insert to add a record to the database. The success of the insert is returned. Trying to insert a record that already exists is not allowed. If you need to update a record, use dba_replace.

```
<?
  // open database in write mode
  $db = dba_popen('inventory', 'w', 'gdbm');

  if($db)
  {
    //check for record
    if(dba_exists('3', $db))
    {
      //item 3 exists, set inventory to 150
      dba_replace('3', '150', $db);
    }
    else
    {
     //item 3 doesn't exists, insert it
     dba_insert('3', '150', $db);
   }

   // close database
   dba_close($db);
 }
 else
 {
   print('Database does not exist');
 }
?>
```

string dba_nextkey(integer link)

The dba_nextkey function returns the next key from the database. When there are no keys left, false is returned. The description of dba_fetch shows a typical use of dba_nextkey and dba_firstkey together.
