PHP Installation on Linux or Unix with Apache

If you plan to install PHP on Linux or any other variant of Unix, then here is the list of prerequisites −

- The PHP source distribution http://www.php.net/downloads.php
- The latest Apache source distribution https://httpd.apache.org/download.cgi
- A working PHP-supported database, if you plan to use one (*For example* MySQL, Oracle etc.)
- Any other supported **software** to which PHP must connect (mail server, BCMath package, JDK, and so forth)
- An ANSI C compiler
- Gnu make utility − you can freely download it at https://www.gnu.org/software/make

Keyword

Software is a generic term that refers to a collection of data or computer instructions that tell the computer how to work, in contrast to the physical hardware from which the system is built, that actually performs the work.

Now here are the steps to install Apache and PHP5 on your Linux or Unix machine. If your PHP or Apache versions are different then please take care accordingly.

- If you haven't already done so, unzip and untar your Apache source distribution. Unless you have a reason to do otherwise, /usr/local is the standard place.

```
gunzip -c apache_1.3.x.tar.gz
tar -xvf apache_1.3.x.tar
```

- Build the apache Server as follows

```
cd apache_1.3.x
./configure --prefix=/usr/local/apache --enable-so
make
make install
```

- Unzip and untar your PHP source distribution. Unless you have a reason to do otherwise, /usr/local is the standard place.
