```
?>
```

After 5 consecutive calls, the $value is equal to 5.

```
$ php nonstatic.php
2
$ php static.php
6
```

3.1.7 PHP anonymous functions

Anonymous functions do not have a name.

anonymous.php

```
<?php

$var = function() {

    echo "This is anonymous function\n";
};

$var();

?>
```

We assign a function body to a variable. It is possible to call the function only via this variable.

```
$var = function () {

    echo "This is anonymous function\n";
};
```

Notice the semicolon after the closing curly bracket. It is required because the construct is an assignment.

```
$ php anonymous.php
This is anonymous function
```

This is the output of the example.

Remember

A function name must start with a letter or underscore character not with a number, optionally followed by the more letters, numbers, or underscore characters. Function names are case-insensitive.
