```
    array(1,'two'),
    'apple'
);

// convert to a string
$string = json_encode($myvar);

echo $string;
/* prints
["hello",42,[1,"two"],"apple"]
*/

// you can reproduce the original variable
$newvar = json_decode($string);

print_r($newvar);
/* prints
Array
(
    [0] => hello
    [1] => 42
    [2] => Array
        (
            [0] => 1
            [1] => two
        )

    [3] => apple
)
*/
```

It is more compact, and best of all, compatible with **javascript** and many other languages. However, for complex objects, some information may be lost.

Keyword

JavaScript often abbreviated as JS, is a high-level, interpreted programming language.
