You can even customize the chunk size by implementing the `WithCustomChunkSize` interface:

```
class TransactionsExport implements FromQuery, WithCustomChunkSize
{
  public function query()
  {
    //  ...
  }

  public function chunkSize(): int
  {
    return 250;
  }
}
```

Now laravel-excel will query and handle 250 records at once. Unfortunately, no magic number works best for every project. Test your exports with different settings and decide based on the results. Also, note that chunking is no magic pill. It saves memory, of course, but usually, it uses more CPU since it needs to do more things.
