```
public function balance(User $user): Money
{
  $startDate = $user->last_payout?->created_at ?? $user->created_at;

  $balance = $this
     ->whereUser($user)
     ->whereBetween('created_at', [
         $startDate,
         now(),
     ])
     ->sum('revenue');

  return Money::USD($balance);
}
```

If the user has a last payout then that's the start date. If they are a new user we'll use the `created_at` date as a starting point. Then all we need is the sum of the `revenue` column between these dates. Since we don't have a `DateInterval` it's easier to just use `whereBetween` here. However, we can refactor it:

```
$balance = $this
   ->whereUser($user)
   ->whereCreatedBetween(DateInterval::make(
     StartDate::fromCarbon($startDate),
     EndDate::fromCarbon(now()),
   ))
   ->sum('revenue');
```

It's not that bad, but we can go a step further and hide this `DateInterval` creation in the `DateInterval` class itself:
