```php
namespace App\ValueObjects;

class DateInterval
{
  public function __construct(
    public StartDate $startDate,
    public EndDate $endDate,
  ) {}

  public static function make(StartDate $startDate, EndDate $endDate): self
  {
    return new self($startDate, $endDate);
  }

  public static function fromCarbons(Carbon $startDate, Carbon $endDate): self
  {
    return new self(
      StartDate::fromCarbon($startDate),
      EndDate::fromCarbon($endDate),
    );
  }
}
```

And now the query looks much simpler:

```php
$balance = $this
  ->whereUser($user)
  ->whereCreatedBetween(DateInterval::fromCarbons($startDate, now()))
  ->sum('revenue');
```

And I think this is the perfect time to ask ourselves the question:
