```
Schema::create('transactions', function (Blueprint $table) {
  $table->id();
  $table->unsignedBigInteger('user_id');
  $table->timestamps();
  // ...

  $table->index('user_id');

  $table->index('created_at');
});
```

So there are two separate indices for the two columns. I think that's a common default choice for lots of developers.

Let's modify the query for a minute and filter it only by the user ID:

```
select
  `...`
from
  `transactions`
where
  `user_id` = 1
order by
  `created_at` asc
limit
  250 offset 0
```

Now the query takes only **45ms**:
