Sending payout

Probably the most important feature of this application is sending payouts. So let's do that and see what we can improve. These are the queries in a `SendPayoutJob`:

Queries (14) Models (6) Jobs (1)

Query 14 queries, 2 of which are duplicated.	Duration 176.12ms
`delete from `jobs` where `id` = 34`	0.21ms
`select * from `jobs` where `id` = 34 limit 1 for update`	0.20ms
`insert into `jobs` (`queue`, `attempts`, `reserved_at`, `available_at`, `created_at`, `payload`) values...`	0.36ms
`select * from `transaction_reports` where `transaction_reports`.`id` = 49 limit 1`	0.21ms
`select * from `users` where `users`.`id` = 1 limit 1`	0.30ms
`select * from `webhooks` where `user_id` = 1 and `event` = 'payout_sent' limit 1`	1.79ms
`update `transactions` set `payout_id` = 3, `transactions`.`updated_at` = '2024-01-11 21:30:59' where `id`...`	150.29ms
`select `id` from `transactions` where `transactions`.`user_id` = 1 and `transactions`.`user_id` is not null...`	7.59ms
`insert into `activity_log` (`log_name`, `properties`, `batch_uuid`, `event`, `subject_id`, `subject_type`...`	0.49ms
`select * from `payouts` where `id` = 3 limit 1`	0.43ms
`insert into `payouts` (`uuid`, `user_id`, `paid_at`, `year`, `month`, `amount`, `status`...`	0.77ms
`select sum(`balance_earnings`) as aggregate from `transactions` where `transactions`.`user_id` = 1 and...`	12.79ms
`select * from `transaction_reports` where `transaction_reports`.`id` = 49 limit 1`	0.33ms
`select * from `users` where `users`.`id` = 1 limit 1`	0.36ms

All in all, we execute 14 queries per user. 3 of them were executed by Laravel. It's not that bad in my opinion. But there's one query that took 150ms. And it's an update. Interesting. Let's see what's inside:
